

<https://www.sublimetext.com/3>

From within Sublime Text 3 navigate to 'Tools'>'Build System'>'New Build System'

Then, configure your build system file similar to this (note our directories may differ):

```
{  
  "cmd": ["C:\\\\ProgramData\\\\Anaconda3\\\\python.exe", "$file"],  
  "selector": "source.python"  
}
```

save it and name it something appropriate like 'anaconda_custom.sublime-build'

then open your python file and execute the Ctrl-Shift-B command to select the build option 'anaconda_custom' to build using the conda python.exe.
